| <b>3. PIN CONFIGURATION</b> .....                                                    | <b>6</b>  |
| <b>4. PIN DESCRIPTIONS</b> .....                                                     | <b>7</b>  |
| 4.1. SIGNAL TYPE DEFINITION.....                                                     | 7         |
| 4.2. POWER PINS.....                                                                 | 7         |
| 4.3. PCI BUS INTERFACE PINS.....                                                     | 7         |
| 4.4. MEMORY INTERFACE PINS (INCLUDING BROM, EEPROM).....                             | 8         |
| 4.5. MEDIUM INTERFACE PINS.....                                                      | 9         |
| 4.6. LED OUTPUT PINS.....                                                            | 9         |
| <b>5. REGISTER DESCRIPTIONS</b> .....                                                | <b>10</b> |
| 5.1. GROUP 1: NE2000 REGISTERS.....                                                  | 10        |
| 5.1.1. <i>Register Table</i> .....                                                   | 10        |
| 5.1.2. <i>Register Functions</i> .....                                               | 12        |
| 5.1.2.1. NE2000 Compatible Registers .....                                           | 12        |
| CR: Command Register (00H; Type=R/W) .....                                           | 12        |
| ISR: Interrupt Status Register (07H; Type=R/W in Page0) .....                        | 13        |
| IMR: Interrupt Mask Register (0FH; Type=W in Page0, Type=R in Page2) .....           | 14        |
| DCR: Data Configuration Register (0EH; Type=W in Page0, Type=R in Page2).....        | 14        |
| TCR: Transmit Configuration Register (0DH; Type=W in Page0, Type=R in Page2) .....   | 14        |
| TSR: Transmit Status Register (04H; Type=R in Page0) .....                           | 15        |
| RCR: Receive Configuration Register (0CH; Type=W in Page0, Type=R in Page2).....     | 15        |
| RSR: Receive Status Register (0CH; Type=R in Page0) .....                            | 15        |
| CLDA0,1: Current Local DMA Registers (01H & 02H; Type=R in Page0) .....              | 16        |
| PSTART: Page Start Register (01H; Type=W in Page0, Type=R in Page 2) .....           | 16        |
| PSTOP: Page Stop Register (02H; Type=W in Page0, Type=R in Page2) .....              | 16        |
| BNRY: Boundary Register (03H; Type=R/W in Page0).....                                | 16        |
| TPSR: Transmit Page Start Register (04H; Type=W in Page0).....                       | 16        |
| TBCR0,1: Transmit Byte Count Registers (05H & 06H; Type=W in Page0).....             | 16        |
| NCR: Number of Collisions Register (05H; Type=R in Page0).....                       | 16        |
| FIFO: First In First Out Register (06H; Type=R in Page0) .....                       | 16        |
| CRDA0,1: Current Remote DMA Address registers (08H & 09H; Type=R in Page0) .....     | 16        |
| RSAR0,1: Remote Start Address Registers (08H & 09H; Type=W in Page0).....            | 16        |
| RBCR0,1: Remote Byte Count Registers (0AH & 0BH; Type=W in Page0) .....              | 16        |
| CNTR0: Frame Alignment Error Tally Counter Register (0DH; Type=R in Page0).....      | 16        |
| CNTR1: CRC Error Tally Counter Register (0EH; Type=R in Page0) .....                 | 17        |
| CNTR2: Missed Packet Tally Counter Register (0FH; Type=R in Page0) .....             | 17        |
| PAR0-5: Physical Address Registers (01H - 06H; Type=R/W in Page1) .....              | 17        |
| CURR: Current Page Register (07H; Type=R/W in Page1).....                            | 17        |
| MAR0-7: Multicast Address Register (08H - 0FH; Type=R/W in Page1) .....              | 17        |
| 5.1.2.2. RTL8029AS Defined Registers .....                                           | 17        |
| 9346CR: 9346 Command Register (01H; Type=R/W except Bit0=R).....                     | 18        |
| CONFIG0: RTL8029AS Configuration Register 0 (03H; Type=R).....                       | 18        |
| CONFIG1: Reserved.....                                                               | 18        |
| CONFIG2: RTL8029AS Configuration Register 2 (05H; Type=R except Bit[7:5]=R/W).....   | 18        |
| CONFIG3: RTL8029AS Configuration Register 3 (06H; Type=R except Bit[6,2:1]=R/W)..... | 19        |
| HLTCLK: Halt Clock Register (09H; Type=W) .....                                      | 20        |
| 8029ASID0,1: RTL8029AS ID = 8029H (0E, 0FH; Type=R) .....                            | 20        |
| 5.2. GROUP 2: PCI CONFIGURATION SPACE REGISTERS .....                                | 20        |
| 5.2.1. <i>PCI Configuration Space Table</i> .....                                    | 20        |
| 5.2.2. <i>PCI Configuration Space functions</i> .....                                | 21        |
| VID: Vendor ID Register (01-00H; Type=R) .....                                       | 21        |
| DID: Device ID Register (03-02H; Type=R).....                                        | 21        |
| RID: Revision ID Register (08H; Type=R).....                                         | 22        |

|                                                                                         |           |
|-----------------------------------------------------------------------------------------|-----------|
| Command: Command Register (05-04H; Type=R except Bit1, 0=R/W).....                      | 22        |
| Status: Status Register (07-06H; Type=R).....                                           | 22        |
| PIFR: Programming InterFace Register (09H; Type=R).....                                 | 23        |
| SCR: Sub-Class Register (0AH; Type=R).....                                              | 23        |
| BCR: Base-Class Register (0BH; Type=R).....                                             | 23        |
| HTR: Header Type Register (0EH; Type=R).....                                            | 23        |
| LTR: Latency Timer Register (0DH; Type=R).....                                          | 23        |
| BAR: Base Address Register (13-10H; Type=R/W except Bit4-0=R).....                      | 23        |
| SVID: Subsystem Vendor ID Register (2C-2DH; Type=R).....                                | 23        |
| SID: Subsystem ID Register (2E-2FH; Type=R).....                                        | 24        |
| BROMBAR: Boot ROM Base Address Register (33-30H; Type=R/W except Bit12-1=R).....        | 24        |
| ILR: Interrupt Line Register (3CH; Type=R/W).....                                       | 24        |
| IPR: Interrupt Pin Register (3DH; Type=R).....                                          | 24        |
| <b>6. FUNCTION DESCRIPTION.....</b>                                                     | <b>25</b> |
| 6.1. RTL8029AS CONFIGURATION PROCESS .....                                              | 25        |
| 6.2. 9346 CONTENTS .....                                                                | 26        |
| 6.2.1 Detail values of 9346 CONFIG2-3 & 8029ASID0-1 bytes .....                         | 26        |
| 6.2.2 ID PROM Contents.....                                                             | 27        |
| 6.3. LOCAL MEMORY BUS CONTROL .....                                                     | 28        |
| 6.4. FLOW CONTROL.....                                                                  | 28        |
| 6.4.1. Control Frame Transmission .....                                                 | 28        |
| 6.4.2. Control Frame Reception .....                                                    | 28        |
| 6.5. LED BEHAVIORS .....                                                                | 29        |
| 6.5.1 LED_TX: Tx LED .....                                                              | 29        |
| 6.5.2 LED_RX: Rx LED.....                                                               | 29        |
| 6.5.3 LED_CRS=LED_TX+LED_RX: Carrier Sense LED .....                                    | 30        |
| 6.5.4 LED_COL: Collision LED .....                                                      | 30        |
| 6.5.5 LED Output States in Power Down Modes.....                                        | 31        |
| 6.6. LOOPBACK DIAGNOSTIC OPERATION.....                                                 | 31        |
| 6.6.1. Loopback operation.....                                                          | 31        |
| (1) CRC enabled (CRC bit in TCR=0) .....                                                | 32        |
| (2) CRC disabled (CRC bit in TCR=1).....                                                | 32        |
| 6.6.2. To Implement Loopback Test.....                                                  | 32        |
| (1) To verify the integrity of data path.....                                           | 32        |
| (2) To verify CRC logic .....                                                           | 32        |
| (3) To verify the address recognition function .....                                    | 33        |
| (4) To Test Cable Connection .....                                                      | 33        |
| <b>7. ELECTRICAL SPECIFICATIONS AND TIMINGS.....</b>                                    | <b>35</b> |
| 7.1. ABSOLUTE MAXIMUM RATINGS .....                                                     | 35        |
| 7.2. D.C. CHARACTERISTICS (T <sub>C</sub> =0 °C to 70 °C, V <sub>CC</sub> =5V±5%) ..... | 35        |
| 7.3. A.C. TIMING CHARACTERISTICS.....                                                   | 35        |
| 7.3.1. PCI Configuration Read/Write .....                                               | 35        |
| 7.3.1.1. Configuration Read.....                                                        | 36        |
| 7.3.1.2. Configuration Write .....                                                      | 36        |
| 7.3.2. PCI I/O Read/Write .....                                                         | 37        |
| 7.3.2.1. PCI I/O Read .....                                                             | 37        |
| 7.3.2.2. PCI I/O Write.....                                                             | 37        |
| 7.3.4. Output Timing for PCI Interface.....                                             | 38        |
| 7.3.5. Input Timing for PCI Interface .....                                             | 38        |
| 7.3.6. Serial EEPROM (9346) Auto-load.....                                              | 39        |

## **1. FEATURES**

- 100-pin PQFP
- ✳ **Pin-to-pin compatible with RTL8029**
- ✳ **16K byte SRAM built in**
- ✳ **Compliance to PCI V2.1**
- ✳ **Programmable PCI Vendor ID and Sub Vendor ID**
- PCI local bus single-chip Ethernet controller
- Compliant to Ethernet II and IEEE802.3 10Base5, 10Base2, 10BaseT
- Supports Full-Duplex Ethernet function to double channel bandwidth
- ✳ **Support Flow Control(802.3x) to improve network performance in full-duplex mode**
- Supports three level power down modes:
  - Sleep
  - Power down with internal clock running
  - Power down with internal clock halted
- Built-in data prefetch function to improve performance
- Built-in 10BaseT transceiver
- Provides auto-detect capability between integrated 10BaseT transceiver and Attachment Unit Interface (AUI)
- Supports auto polarity correction for 10BaseT
- Supports Boot ROM function for PCI bus
- Supports 8K, 16K and 32K Boot ROM size
- Use 9346 (64\*16-bit EEPROM) to store resource configurations and ID parameters
- Capable of programming blank 9346 on board for manufacturing convenience
- Supports 4 diagnostic LED pins with programmable outputs

**P.S. “✳” denotes new feature of RTL8029AS**

## **2. GENERAL DESCRIPTION**

The RTL8029AS controller is an NE2000 compatible Ethernet Controller for PCI interface. Taking the benefit of PCI's high throughput rate, the RTL8029AS controller offers a 32-bit data path to highly improve the data transfer rate compared with traditional Ethernet card on ISA, EISA and MCA bus. Due to the additional benefits of PCI, the RTL8029AS controller provides a low maintaining cost network environment without usage barriers. The Auto-configuration function of PCI can relieve the users from pains of taking care the system resource conflict. The RTL8029AS controller also supports full-duplex and power down features. With three levels power down control features, the RTL8029AS controller is made to be an ideal choice of the network device for a GREEN PCI PC system. The full-duplex function enables simultaneously transmission and reception on the twisted-pair link to a full-duplex Ethernet switching hub. This feature not only increases the channel bandwidth from 10 to 20 Mbps but also avoids the performance degrading problem due to the channel contention characteristics of the Ethernet CSMA/CD protocol.

The RTL8029AS controller requires no glue logic and integrates with Manchester Encoder/Decoder and 10BaseT transceiver on chip. The built-in 10BaseT transceiver can automatically correct the polarity error on its receiving pair. The RTL8029AS controller also has the capability of auto-sensing for 10Base2 or 10BaseT connection. Four diagnostic LEDs supported by RTL8029AS controller simplify the troubleshooting procedure in a network. Furthermore, The RTL8029AS controller supports 8K, 16K & 32K byte Boot ROM. It can be applied in a workstation without disk to improve the network security and management convenience. Data prefetch function in RTL8029AS controller can enhance the data transmission and highly uplift the network performance without extra fee.

### 3. PIN CONFIGURATION

## 4. PIN DESCRIPTIONS

### 4.1. Signal Type Definition

- P** Power pins include VDD and GND.
- I** Input is a standard input-only signal.
- O** It indicates output signal.
- T/S** Tri-State is a bi-directional, tri-state input/output pin.
- S/T/S** Sustained Tri-State is an active low tri-state signal owned and driven by one and only one agent at a time. The agent that drives an S/T/S pin low must drive it high for at least one clock before letting it float.
- O/D** Open Drain allowed multiple device to share as a wire-OR.

### 4.2. Power Pins

| No.                              | Name | Type | Description  |
|----------------------------------|------|------|--------------|
| 22, 39, 52,<br>75, 85, 100       | VDD  | P    | +5V DC power |
| 11, 17, 34,<br>48, 72, 80,<br>91 | GND  | P    | Ground       |

### 4.3. PCI Bus Interface Pins

| No.                                         | Name    | Type | Descriptions                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------|---------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 90                                          | CLK     | I    | Bus Clock provides timing for all transactions on PCI and is an input pin to every PCI device. All bus signals are sampled on the rising edge of CLK and all parameters are defined with respect to this edge.                                                                                                                                                                                                                               |
| 92-99, 3-10, 20, 21,<br>23-28, 30-33, 35-38 | AD31-0  | T/S  | Address/Data are multiplexed on the same PCI pins. A bus transaction consists of an address phase followed by one or more data phases. The address phase is the clock cycle in which FRAMEB is asserted. During data phase AD7-0 contain the least significant byte(lsb) and AD31-24 contain the most significant byte(msb). Write data is stable and valid when IRDYB is asserted and read data is stable and valid when TRDYB is asserted. |
| 1, 12, 19,<br>29                            | CBE3-0B | T/S  | Bus Command/Byte Enables are multiplexed on the same PCI pins. During the address phase of a transaction, CBE3-0B define the Bus Command. During the data phase CBE3-0B are used as Byte Enables. The Byte Enables define which physical byte lanes carry meaning data. CBE0B applies to byte 0(lsb) and CBE3B applies to byte 3(msb).                                                                                                       |

|    |         |       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----|---------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 18 | PAR     | T/S   | Parity is even parity across AD31-0 and CBE3-0B. PAR is stable and valid one clock after the address phase. For data phases PAR is stable and valid one clock after either IRDYB is asserted on a write transaction or TRDYB is asserted on a read transaction.                                                                                                                                                                                                  |
| 13 | FRAMEB  | S/T/S | Cycle Frame is driven by the current master to indicate the beginning and duration of an access. FRAMEB is asserted to indicate a bus transaction is beginning. While FRAMEB is asserted, data transfers continue. When FRAMEB is deasserted, the transaction is in the final data phase.                                                                                                                                                                        |
| 14 | IRDYB   | S/T/S | Initiator Ready indicates the initiating agent's ability to complete the current data phase of the transaction. IRDYB is used in conjunction with TRDYB. A data phase is completed on any clock when both IRDYB and TRDYB are asserted. During a write, IRDYB indicates that valid data is present on AD31-0. During a read, it indicates the master is prepare to accept data. Wait cycles are inserted until both IRDYB and TRDYB are asserted simultaneously. |
| 15 | TRDYB   | S/T/S | Target Ready indicates the target's agent's ability to complete the current data phase of the transaction. TRDYB is used in conjunction with IRDYB. A data phase is completed on any clock when both TRDYB and IRDYB are asserted. During a read, TRDYB indicates that valid data is present on AD31-0. During a write, it indicates the target is prepare to accept data. Wait cycles are inserted until both IRDYB and TRDYB are asserted simultaneously.      |
| 16 | DEVSELB | S/T/S | Device Select, when actively driven, indicates the driving device has decoded its address as the target of the current access. As an input, DEVSELB indicates whether any device on the bus has been selected.                                                                                                                                                                                                                                                   |
| 2  | IDSEL   | I     | Initialization Device Select is used as a chip select for RTL8029AS controller during configuration read and write transaction.                                                                                                                                                                                                                                                                                                                                  |
| 89 | RSTB    | I     | When RSTB is asserted low, the RTL8029AS performs an internal system hardware reset. RSTB must be held for a minimum of 120 ns periods. RSTB may be asynchronous to CLK when asserted or deasserted. It is recommended that the deassertion be synchronous to guarantee clean and bounce free edge.                                                                                                                                                              |
| 88 | INTAB   | O/D   | Interrupt A is an asynchronous attention signal which is used to request an interrupt.                                                                                                                                                                                                                                                                                                                                                                           |

#### 4.4. Memory Interface Pins (including BROM, EEPROM)

| No.       | Name   | Type | Description                                                              |
|-----------|--------|------|--------------------------------------------------------------------------|
| 49        | BOEB   | O    | Boot ROM chip select. Active low signal, asserted when Boot ROM is read. |
| 50        | NC     | -    | Unused                                                                   |
| 53        | EECS   | O    | 9346 chip select. Active high signal, asserted when 9346 is read/write.  |
| 51, 67-54 | MA14-0 | O    | Boot ROM address bus                                                     |
| [57]      | [EESK] | O    | 9346 serial data clock                                                   |

|       |        |     |                         |
|-------|--------|-----|-------------------------|
| [56]  | [EEDI] | O   | 9346 serial data input  |
| [55]  | [EEDO] | I   | 9346 serial data output |
| 40-47 | MD7-0  | I/O | Boot ROM data bus       |

## 4.5. Medium Interface Pins

| No.    | Name          | Type | Description                                                                                                                                                                                        |
|--------|---------------|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 82, 81 | CD+,CD-       | I    | This AUI collision input pair carries the differential collision input signal from the MAU.                                                                                                        |
| 84, 83 | RX+,RX-       | I    | This AUI receive input pair carries the differential receive input signal from the MAU.                                                                                                            |
| 77, 76 | TX+,TX-       | O    | This AUI transmit output pair contains differential line drivers which send Manchester encoded data to the MAU. These outputs are source followers and require 270 ohm pull-down resistors to GND. |
| 87, 86 | TPIN+,TPIN-   | I    | This TP input pair receives the 10 Mbits/s differential Manchester encoded data from the twisted-pair wire.                                                                                        |
| 73, 74 | TPOUT+,TPOUT- | O    | This pair carries the differential TP transmit output. The output Manchester encoded signals have been pre-distorted to prevent overcharge on the twisted-pair media and thus reduce jitters.      |
| 78     | X1            | I    | 20Mhz crystal or external oscillator input.                                                                                                                                                        |
| 79     | X2            | O    | Crystal feedback output. This output is used in crystal connection only. It must be left open when X1 is driven with an external oscillator.                                                       |

## 4.6. LED Output Pins

| No.    | Name      | Type | Description                                                                                                                                                                                                                                                                       |
|--------|-----------|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 71     | LED_BNC   | O    | This pin goes high when RTL8029AS's medium type is set to 10Base2 mode or auto-detect mode with link test failure. Otherwise, this pin is low. This pin can be used to control the power of the DC converter for CX MAU and connected to an LED to indicate the used medium type. |
| 70     | LED0      | O    | When LEDS0 bit (in CONFIG3 register of RTL8029AS Page3) is 0, this pin acts as LED_COL. When LEDS0=1, it acts as LED_LINK.                                                                                                                                                        |
| 69, 68 | LED1,LED2 | O    | When LEDS1 bit (in CONFIG3 register of RTL8029AS Page3) is 0, these 2 pins act as LED_RX & LED_TX respectively. When LEDS1=1, these pins act as LED_CRIS & MCSB. Please refer to section 6.5 for details of the lightening behavior of all LEDs.                                  |

## 5. REGISTER DESCRIPTIONS

The registers in RTL8029AS controller can be roughly divided into two groups by their address and functions -- one for NE2000, the other for PCI Configuration Space.

### 5.1. Group 1: NE2000 Registers

This group includes 4 pages of registers which are selected by bit PS0 & PS1 in the CR register. Each page contains 16 registers. Besides those registers compatible with NE2000, the RTL8029AS controller defines some registers for software configuration and feature enhancement.

#### 5.1.1. Register Table

| No (Hex) | Page0           |        | Page1 | Page2  | Page3            |                |
|----------|-----------------|--------|-------|--------|------------------|----------------|
|          | [R]             | [W]    | [R/W] | [R]    | [R]              | [W]            |
| 00       | CR              | CR     | CR    | CR     | CR               | CR             |
| 01       | CLDA0           | PSTART | PAR0  | PSTART | <b>9346CR</b>    | <b>9346CR</b>  |
| 02       | CLDA1           | PSTOP  | PAR1  | PSTOP  | -                | -              |
| 03       | BNRY            | BNRY   | PAR2  | -      | <b>CONFIG0</b>   | -              |
| 04       | TSR             | TPSR   | PAR3  | TPSR   | -                | -              |
| 05       | NCR             | TBCR0  | PAR4  | -      | <b>CONFIG2</b>   | <b>CONFIG2</b> |
| 06       | FIFO            | TBCR1  | PAR5  | -      | <b>CONFIG3</b>   | <b>CONFIG3</b> |
| 07       | ISR             | ISR    | CURR  | -      | -                | -              |
| 08       | CRDA0           | RSAR0  | MAR0  | -      | -                | -              |
| 09       | CRDA1           | RSAR1  | MAR1  | -      | -                | <b>HLTCLK</b>  |

Notes: The registers marked with type='W\*' can be written only if bits EEM1=EEM0=1.

**Notes: "\*" denotes the bits or registers which are RTL8029AS defined bits or registers and are not supported in RTL8029.**

## 5.1.2. Register Functions

### 5.1.2.1. NE2000 Compatible Registers

#### CR: Command Register (00H; Type=R/W)

This register is used to select register pages, enable or disable remote DMA operation and issue commands.

| Bit  | Symbol   | Description                                                                                                                                                                                                                                                                                                                                                                                         |                           |               |                   |          |   |               |   |                   |              |   |   |                   |   |   |   |                   |   |   |   |                         |   |   |   |                           |

### ISR: Interrupt Status Register (07H; Type=R/W in Page0)

This register reflects the NIC status. The host reads it to determine the cause of an interrupt. Individual bits are cleared by writing a "1" into the corresponding bit. It must be cleared after power up.

| Bit | Symbol | Description                                                                                                                                                                                                               |
|-----|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7   | RST    | This bit is set when NIC enters reset state and is cleared when a start command is issued to the CR. It is also set when receive buffer overflows and is cleared when one or more packets have been read from the buffer. |
| 6   | RDC    | Set when remote DMA operation has been completed.                                                                                                                                                                         |
| 5   | CNT    | Set when MSB of one or more of the network tally counters has been set.                                                                                                                                                   |
| 4   | OVW    | This bit is set when the receive buffer has been exhausted.                                                                                                                                                               |
| 3   | TXE    | Transmit error bit is set when a packet transmission is aborted due to excessive collisions.                                                                                                                              |
| 2   | RXE    | <p>This bit is set when a packet received with one or more of the following errors:</p> <ul style="list-style-type: none"> <li>- CRC error</li> <li>- Frame alignment error</li> <li>- Missed packet</li> </ul>           |
| 1   | PTX    | This bit indicates packet transmitted with no errors.                                                                                                                                                                     |
| 0   | PRX    | This bit indicates packet received with no errors.                                                                                                                                                                        |

**IMR: Interrupt Mask Register (0FH; Type=W in Page0, Type=R in Page2)**

All bits correspond to the bits in the ISR register. POWER UP=all 0s. Setting individual bits will enable the corresponding interrupts.

**DCR: Data Configuration Register (0EH; Type=W in Page0, Type=R in Page2)**

| Bit  | Symbol   | Description                                                                                                                                       |

| 0          | normal   | enabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | enabled           |     |                      |        |         |      |               |                  |   |        |         |                   |   |        |          |                   |   |          |         |                   |   |          |          |         |
| 1          | normal   | disabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | enabled           |     |                      |        |         |      |               |                  |   |        |         |                   |   |        |          |                   |   |          |         |                   |   |          |          |         |
| 0          | loopback | enabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | disabled          |     |                      |        |         |      |               |                  |   |        |         |                   |   |        |          |                   |   |          |         |                   |   |          |          |         |
| 1          | loopback | disabled                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | enabled           |     |                      |        |         |      |               |                  |   |        |         |                   |   |        |          |                   |   |          |         |                   |   |          |          |         |

**TSR: Transmit Status Register (04H; Type=R in Page0)**

This register indicates the status of a packet transmission.

| Bit | Symbol | Description                                                                                                                                                                                                           |
|-----|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7   | OWC    | Out of Window Collision. It is set when a collision is detected after a slot time (51.2us). Transmissions are rescheduled as in normal collisions.                                                                    |
| 6   | CDH    | CD Heartbeat. The NIC watches for a collision signal (i.e., CD Heartbeat signal) during the first 6.4us of the interframe gap following a transmission. This bit is set if the transceiver fails to send this signal. |
| 5   | -      | Always 0.                                                                                                                                                                                                             |
| 4   | CRS    | Carrier Sense lost bit is set when the carrier is lost during transmitting a packet.                                                                                                                                  |
| 3   | ABT    | It indicates the NIC aborted the transmission because of excessive collisions.                                                                                                                                        |
| 2   | COL    | It indicates the transmission collided with some other station on the network.                                                                                                                                        |
| 1   | -      | Always 1.                                                                                                                                                                                                             |
| 0   | PTX    | This bit indicates the transmission completes with no errors.                                                                                                                                                         |

**RCR: Receive Configuration Register (0CH; Type=W in Page0, Type=R in Page2)**

| Bit  | Symbol | Description                                                                                                                                                                           |
|------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7, 6 | -      | Always 1.                                                                                                                                                                             |
| 5    | MON    | When monitor mode bit is set, received packets are checked for address match, good CRC and frame alignment but not buffered to memory. Otherwise, packets will be buffered to memory. |
| 4    | PRO    | If PRO=1, all packets with physical destination address accepted.<br>If PRO=0, physical destination address must match the node address programmed in PAR0-5.                         |
| 3    | AM     | If AM=1, packets with multicast destination address are accepted.<br>If AM=0, packets with multicast destination address are rejected.                                                |
| 2    | AB     | If AB=1, packets with broadcast destination address are accepted.<br>If AB=0, packets with broadcast destination address are rejected.                                                |
| 1    | AR     | If AR=1, packets with length fewer than 64 bytes are accepted.<br>If AR=0, packets with length fewer than 64 bytes are rejected.                                                      |
| 0    | SEP    | If SEP=1, packets with receive errors are accepted.<br>If SEP=0, packets with receive errors are rejected.                                                                            |

**RSR: Receive Status Register (0CH; Type=R in Page0)**

| Bit | Symbol | Description                                                                                                                                                                   |
|-----|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7   | DFR    | Deferring. Set when a carrier or a collision is detected.                                                                                                                     |
| 6   | DIS    | Receiver Disabled. When the NIC enters the monitor mode, this bit is set and receiver is disabled. Reset when receiver is enabled after leaving the monitor mode.             |
| 5   | PHY    | PHY bit is set when the received packet has a multicast or broadcast destination address. It is reset when the received packet has a physical destination address.            |
| 4   | MPA    | Missed Packet bit is set when the incoming packet can not be accepted by NIC because of a lack of receive buffer or if NIC is in monitor mode. Increment CNTR2 tally counter. |
| 3   | -      | Always 0.                                                                                                                                                                     |
| 2   | FAE    | Frame Alignment Error bit reflects the incoming packet didn't end on a byte boundary and CRC did not match at last byte boundary. Increment CNTR0 tally counter.              |

|   |     |                                                                                                                                 |
|---|-----|---------------------------------------------------------------------------------------------------------------------------------|
| 1 | CRC | CRC error bit reflects packet received with CRC error. This bit will also be set for FAE errors. Increment CNTR1 tally counter. |
| 0 | PRX | This bit indicates packet received with no errors.                                                                              |

**CLDA0,1: Current Local DMA Registers (01H & 02H; Type=R in Page0)**

These two registers can be read to get the current local DMA address.

**PSTART: Page Start Register (01H; Type=W in Page0, Type=R in Page 2)**

The Page Start register sets the start page address of the receive buffer ring.

**PSTOP: Page Stop Register (02H; Type=W in Page0, Type=R in Page2)**

The Page Stop register sets the stop page address of the receive buffer ring.

**BNRY: Boundary Register (03H; Type=R/W in Page0)**

This register is used to prevent overwrite of the receive buffer ring. It is typically used as a pointer indicating the last receive buffer page the host has read.

**TPSR: Transmit Page Start Register (04H; Type=W in Page0)**

This register sets the start page address of the packet to be transmitted.

**TBCR0,1: Transmit Byte Count Registers (05H & 06H; Type=W in Page0)**

These two registers set the byte counts of the packet to be transmitted.

**NCR: Number of Collisions Register (05H; Type=R in Page0)**

The register records the number of collisions a node experiences during a packet transmission.

**FIFO: First In First Out Register (06H; Type=R in Page0)**

This register allows the host to examine the contents of the FIFO after loopback.

**CRDA0,1: Current Remote DMA Address registers (08H & 09H; Type=R in Page0)**

These two registers contain the current address of remote DMA.

**RSAR0,1: Remote Start Address Registers (08H & 09H; Type=W in Page0)**

These two registers set the start address of remote DMA.

**RBCR0,1: Remote Byte Count Registers (0AH & 0BH; Type=W in Page0)**

These two registers set the data byte counts of remote DMA.

**CNTR0: Frame Alignment Error Tally Counter Register (0DH; Type=R in Page0)**

**CNTR1: CRC Error Tally Counter Register (0EH; Type=R in Page0)**

**CNTR2: Missed Packet Tally Counter Register (0FH; Type=R in Page0)**

**PAR0-5: Physical Address Registers (01H - 06H; Type=R/W in Page1)**

These registers contain my Ethernet node address and are used to compare the destination address of incoming packets for acceptance or rejection.

**CURR: Current Page Register (07H; Type=R/W in Page1)**

This register points to the page address of the first receive buffer page to be used for a packet reception.

**MAR0-7: Multicast Address Register (08H - 0FH; Type=R/W in Page1)**

These registers provide filtering bits of multicast addresses hashed by the CRC logic.

### 5.1.2.2. RTL8029AS Defined Registers

#### Page 0 (PS1=0, PS0=0)

Two registers are defined to contain the RTL8029AS chip ID and Read Sequence Command is NO LONGER supported in RTL8029AS.

| No. | Name    | Type | Bit7-0                  |
|-----|---------|------|-------------------------|
| 0AH | 8029ID0 | R    | 50H (ASCII code of "P") |

| 6     | FUDUP    | When this bit is set, RTL8029AS is set to the full-duplex mode which enables simultaneously transmission and reception on the twisted-pair link to a full-duplex Ethernet switching hub. This feature not only increases the channel bandwidth from 10 to 20 Mbps but also avoids the performance degrading problem due to the channel contention characteristics of the Ethernet CSMA/CD protocol.                                                                                                                                                                                                                             |       |          |   |         |   |          |       |          |          |   |        |        |   |         |      |

| 1 | PWRDN | <p>This bit, when set, puts RTL8029AS into power down mode.</p> <p>RTL8029AS supports two kinds of power down modes, which is selected by the contents of the HLTCLK register:</p> <p>(1) mode 1: power down with clock running</p> <p>(2) mode 2: power down with clock halted</p> <p>In both power down modes, the RTL8029AS's serial network interface and transceiver are turned off. All network activities are ignored.</p> <p>All LED signals except LED_BNC are forced high. The LED_BNC is forced low to disable the DC converter for coaxial transceiver.</p> <p>In power down mode 2, the RTL8029AS stops its internal clock for minimal power consumption. Registers except HLTCLK are typically not accessible in this mode.</p> <p>This bit's initial value comes from 9346 and can be modified if EEM1=EEM0=1 in 9346CR register.</p> |
| 0 | -     | Unused                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### HLTCLK: Halt Clock Register (09H; Type=W)

This is the only active one of Group1 registers when RTL8029AS is inactivated. Writing to this register is invalid if RTL8029AS is not in power down mode. (i.e., If PWRDN bit in CONFIG3 register is zero.) The data written to this register determines the RTL8029AS's power down mode.

| Data                    | Power Down Mode                |
|-------------------------|--------------------------------|
| 52H (ASCII code of 'R') | Mode 1 - clock <b>R</b> unning |
| 48H (ASCII code of 'H') | Mode 2 - clock <b>H</b> alted  |
| Other values            | Ignored                        |

### 8029ASID0,1: RTL8029AS ID = 8029H (0E,0FH; Type=R)

## 5.2. Group 2: PCI Configuration Space Registers

### 5.2.1. PCI Configuration Space Table

| No. | Name    | Type | Bit 7    | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |

### 5.2.2. PCI Configuration Space functions

The PCI configuration space is intended for configuration, initialization, and catastrophic error handling functions. The functions of RTL8029AS's configuration space are described below.

#### VID: Vendor ID Register (01-00H; Type=R)

The Vendor ID register is a 16-bit register that identifies the manufacturer of the RTL8029AS controller. Realtek Vendor ID = 10ECH(default value)

#### DID: Device ID Register (03-02H; Type=R)

The Device ID register is a 16-bit register that shows the device ID of the RTL8029AS controller. RTL8029AS Device ID = 8029H(default value)

### Command: Command Register (05-04H; Type=R except Bit1, 0=R/W)

The Command register is a 16-bit register used to provide coarse control over a device's ability to generate and respond to PCI cycles.

| Bit   | Symbol   | Description                                                                                                                                                                                                                   |
|-------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15-10 | -        | Reserved area. Read as 0, write operation has no effect.                                                                                                                                                                      |
| 9     | FBTBEN   | Fast Back-To-Back ENable. Read as 0, write operation has no effect. The RTL8029AS will not generate Fast Back-to-Back cycles.                                                                                                 |
| 8     | SERREN   | SERR ENable. Read as 0, write operation has no effect.                                                                                                                                                                        |
| 7     | ADSTEP   | Address/Data STEPping. Read as 0, write operation has no effect. The RTL8029AS never do address/data stepping.                                                                                                                |
| 6     | PERREN   | This bit controls the device's response to parity errors. When the value of this bit is 0, the device must ignore any parity errors that it detects and continues normal operation. Read as 0, write operation has no effect. |
| 5     | VGASNOOP | VGA palette SNOOP. Read as 0, write operation has no effect.                                                                                                                                                                  |
| 4     | MWIEN    | Memory Write and Invalidate cycle ENable. Read as 0, write operation has no effect.                                                                                                                                           |
| 3     | SCYCEN   | Special CYCLE ENable. Read as 0, write operation has no effect. The RTL8029AS ignores all special cycle operation.                                                                                                            |
| 2     | BMEN     | Bus Master ENable. Read as 0, write operation has no effect.                                                                                                                                                                  |
| 1     | MEMEN    | Controls a device's response to memory space accesses.<br>0 : Disable the device response<br>1 : Enable the device response                                                                                                   |
| 0     | IOEN     | Controls a device's response to I/O space accesses.<br>0 : Disable the device response<br>1 : Enable the device response                                                                                                      |

### Status: Status Register (07-06H; Type=R)

The Status register is a 16-bit register used to record status information for PCI bus related events. Reads to this register behave normally. Writes are slightly different in that bits can be reset, but not set.

| Bit  | Symbol | Description                                                                                                                                                         |
|------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15   | DPE    | Detected Parity Error. Read as 0, write operation has no effect.                                                                                                    |
| 14   | SSE    | Signaled System Error. Read as 0, write operation has no effect.                                                                                                    |
| 13   | RMA    | Received Master Abort. Read as 0, write operation has no effect.                                                                                                    |
| 12   | RTA    | Received Target Abort. Read as 0, write operation has no effect.                                                                                                    |
| 11   | STA    | Signaled Target Abort. Read as 0, write operation has no effect.                                                                                                    |
| 10-9 | DST1-0 | These bits encode the timing of DEVSELB. They are set to 01b (medium), indicating the RTL8029AS controller will assert DEVSELB two clocks after FRAMEB is asserted. |
| 8    | DPD    | Data Parity Detected. Read as 0, write operation has no effect.                                                                                                     |
| 7    | FBBC   | Fast Back-to-Back Capable. Read as 0, write operation has no effect.                                                                                                |
| 6-0  | -      | Reserved area. Read as 0, write operation has no effect.                                                                                                            |

### RID: Revision ID Register (08H; Type=R)

The Revision ID register is an 8-bit register that specifies the RTL8029AS controller revision number. Revision ID = 00H

### **PIFR: Programming InterFace Register (09H; Type=R)**

The Programming interface register is an 8-bit register that identifies the programming interface of RTL8029AS controller. PCI doesn't define any other specific register level programming interface for network devices. So PIFR = 00H.

### **SCR: Sub-Class Register (0AH; Type=R)**

The Sub-class register is an 8-bit register that identifies specially the function of the RTL8029AS controller. SCR = 00H indicates that the RTL8029AS controller is an Ethernet controller.

### **BCR: Base-Class Register (0BH; Type=R)**

The Base-class register is an 8-bit register that broadly classifies the function of the RTL8029AS controller. BCR = 02H indicates that the RTL8029AS controller is a network controller.

### **HTR: Header Type Register (0EH; Type=R)**

The header type register is an 8-bit register that describes the layout of bytes 10H through 3FH in configuration space and also whether or not the device contains multiple functions. HTR = 00H

| Bit | Symbol | Description                                                                                                                                                                                                    |
|-----|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7   | FUNC   | single/multi FUNCTION. Read as 0, write operation has no effect.<br>0 : single function device<br>1: multiple functions device<br>The RTL8029AS controller is a single function device                         |
| 6-0 | LAYOUT | PCI configuration space layout. These bits specify the layout of bytes 10H through 3FH. One encoding, 00H is defined and specifies the layout show in section 5.2.1. Read as 0, write operation has no effect. |

### **LTR: Latency Timer Register (0DH; Type=R)**

This register is an 8-bit register. LTR = 00H indicates when the RTL8029AS controller is preempted, it will release the bus immediately after finishing the current data transfer.

### **BAR: Base Address Register (13-10H; Type=R/W except Bit4-0=R)**

The Base Address register is a 32-bit register that determines the I/O space mapping of the RTL8029AS controller.

| Bit  | Symbol  | Description                                                                                                             |
|------|---------|-------------------------------------------------------------------------------------------------------------------------|
| 31-5 | BAR31-5 | These bits are used to set I/O base address for I/O operation.                                                          |
| 4-2  | IOSIZE  | These bits indicate how many I/O spaces to be used. Read as 0, write operation has no effect.                           |
| 1    | -       | Reserved area. Read as 0, write operation has no effect.                                                                |
| 0    | IOIN    | I/O space INDicator. Read as 1, write operation has no effect. Indicating that the base address is an I/O base address. |

### **SVID: Subsystem Vendor ID Register (2C-2DH; Type=R)**

The Subsystem Vendor ID register is a 16-bit register that uniquely identifies the add-in board or subsystem where the PCI device resides. The default value is **10ECH**.

### **SID: Subsystem ID Register (2E-2FH; Type=R)**

The Subsystem ID register is a 16-bit register that are vendor specific. The default value is **8029H**.

### **BROMBAR: Boot ROM Base Address Register (33-30H; Type=R/W except Bit12-1=R)**

The Base Boot ROM Address register is a 32-bit register that determines the Boot ROM space mapping of the RTL8029AS controller.

| Bit   | Symbol   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |     |     |             |   |   |                                          |   |   |                                                                            |   |   |                                                                           |   |   |                                                                         |

### **ILR: Interrupt Line Register (3CH; Type=R/W)**

The Interrupt Line register is an 8-bit register used to communicate with the routing of the interrupt. It is written by the POST software to set interrupt line for the RTL8029AS controller.  
ILR = 00-0FH

### **IPR: Interrupt Pin Register (3DH; Type=R)**

The Interrupt Pin register is an 8-bit register indicating the interrupt pin used by the RTL8029AS controller. The RTL8029AS controller uses the INTA interrupt pin. IPR = 01H

## **6. FUNCTION DESCRIPTION**

### **6.1. RTL8029AS Configuration Process**

The RTL8029AS controller supports PCI configuration operation. In PCI system, the initial process is completed by the system BIOS software. The system BIOS has to find where the system resources are available, such as I/O base address, BROM memory base address, and interrupt request line, and assigns the resources to the required devices. At the same time the RTL8029AS controller performs a series of EEPROM read operation after power-up to set Ethernet ID, media type, operation mode iK, etc. The RTL8029AS's resource configuration information is stored in the PCI configuration space as well as CONFIG registers in Group1 Page3. The CONFIG registers power-up default values always come from the contents of 9346 and the values can be modified by software. The update configuration is only valid temporarily and will be lost after an auto-load command, an active RSTB, or PC power off. Permanent changes of configuration must be done by changing the contents of 9346. Note that the BROM size can not be modified temporarily.

## 6.2. 9346 Contents

The 9346 is a 1K-bit EEPROM. Although it is actually addressed by words, we list its contents by bytes below for convenience.

| Bytes            |                   | Contents              | Comments                                                 |
|------------------|-------------------|-----------------------|----------------------------------------------------------|
| <b>00H - 01H</b> | <b>(2 bytes)</b>  |                       | <b>Power-up initial value of Page3</b>                   |
|                  | 00H               | CONFIG2               | Board Configurations                                     |
|                  | 01H               | CONFIG3               |                                                          |
| <b>02H - 0FH</b> | <b>(14 bytes)</b> |                       | <b>NE2000 ID PROM</b>                                    |

|                  | 78H-79H           | VID0-1                |                                                          |
|                  | 7AH-7BH           | DID0-1                |                                                          |
|                  | 7CH-7DH           | SVID0-1               |                                                          |
|                  | 7EH-7FH           | SID0-1                |                                                          |

### 6.2.1 Detail values of 9346 CONFIG2-3 & 8029ASID0-1 bytes

|                  | Bit 7    | Bit 6    | Bit 5      | Bit 4    | Bit 3    | Bit 2    | Bit 1    | Bit 0    |
|------------------|----------|----------|------------|----------|----------|----------|----------|----------|
| <b>CONFIG2</b>   | PL1      | PL0      | <b>FCE</b> | *        | *        | *        | BS1      | BS0      |
| <b>CONFIG3</b>   | *        | FUDUP    | LEDS1      | LEDS0    | *        | *        | PWRDN    | *        |
| <b>8029ASID0</b> | <b>0</b> | <b>0</b> | <b>1</b>   | <b>0</b> | <b>1</b> | <b>0</b> | <b>0</b> | <b>1</b> |
| <b>8029ASID1</b> | <b>1</b> | <b>0</b> | <b>0</b>   | <b>0</b> | <b>0</b> | <b>0</b> | <b>0</b> | <b>0</b> |

P.S. '\*' denotes don't care.

**Note:** RTL8029AS checks the 8029ASID word in 9346 when power up. If the value matches "8029h", the RTL8029AS works in RTL8029AS mode. You can use all new features defined by RTL8029AS, such as Flow Control, Programmable Vendor ID<sup>o</sup> etc. If the value doesn't match, the RTL8029AS works like RTL8029. All enhanced functions and registers are not available. Also the PCI IDs in 9346 are ignored and the RTL8029's ID(10ECh, 8029h) will be used instead.

### 6.2.2 ID PROM Contents

The RTL8029AS emulates the ID PROM of NE2000 internally. After 9346 is loaded, the contents of ID PROM are as follows.

| offset | Bit7-0                 |
|--------|------------------------|
| 00H    | Ethernet ID0           |
| 01H    | Ethernet ID1           |
| 02H    | Ethernet ID2           |
| 03H    | Ethernet ID3           |
| 04H    | Ethernet ID4           |
| 05H    | Ethernet ID5           |
| 06H    | PID0                   |
| 07H    | PID1                   |
| 08H    | PID2                   |
| 09H    | PID3                   |
| 0AH    | PID4                   |
| 0BH    | PID5                   |
| 0CH    | PID6                   |
| 0DH    | PID7                   |
| 0EH    | 57 (ASCII Code of "W") |
| 0FH    | 57 (ASCII Code of "W") |
| 10H    | Ethernet ID0           |
| 11H    | Ethernet ID1           |
| 12H    | Ethernet ID2           |
| 13H    | Ethernet ID3           |
| 14H    | Ethernet ID4           |
| 15H    | Ethernet ID5           |
| 16H    | PID0                   |
| 17H    | PID1                   |
| 18H    | PID2                   |
| 19H    | PID3                   |

## 6.3. Local Memory Bus Control

The local memory bus of RTL8029AS is shared by the BROM & 9346 EEPROM. The following diagram demonstrates their connection relationship.

**Figure 1. Local Memory Bus Block Diagram**

## 6.4. Flow Control

The RTL8029AS supports IEEE802.3X flow control to improve performance in full-duplex mode. It detects PAUSE packet to achieve flow control task.

### 6.4.1. Control Frame Transmission

When RTL8029AS detects its free receive buffer less than 3K bytes, it sends a **PAUSE packet with pause\_time(=FFFFh)** to inform the source station to stop transmission for the specified period of time. After the driver has processed the packets in the receive buffer and updated the boundary pointer, the RTL8029AS sends the other **PAUSE packet with pause\_time(=0000h)** to wake up the source station to restart transmission.

### 6.4.2. Control Frame Reception

RTL8029AS enters backoff state for the specified period of time when it receives a valid **PAUSE packet with pause\_time(=n)**. If the PAUSE packet is received while RTL8029AS is transmitting, RTL8029AS starts to backoff after current transmission completes. RTL8029AS frees to transmit next packets again when it receives a valid **PAUSE packet with pause\_time(=0000h)** or the **backoff timer(=n\*51.2us)** elapses.

Note: The PAUSE operation cannot be used to inhibit transmission of MAC Control frames (e.g. PAUSE packet).

## 6.5. LED Behaviors

This section describes the lighting behaviors of the LED output signals which may be selected by LEDS1 and LEDS0 bits in the Page3 CONFIG3 register.

P.S. It is assumed that the LED is on when the signal goes low.

### 6.5.1 LED\_TX: Tx LED

### 6.5.2 LED\_RX: Rx LED

### 6.5.3 LED\_CRS=LED\_TX+LED\_RX: Carrier Sense LED

### 6.5.4 LED\_COL: Collision LED

### 6.5.5 LED Output States in Power Down Modes

| LED Output | Normal Mode / Idle | Sleep Mode | Power Down Mode |
|------------|--------------------|------------|-----------------|
| LED_BNC    | -                  | -          | Low             |
| LED_LINK   | -                  | High       | High            |
| LED_COL    | High               | High       | High            |
| LED_TX     | Low                | High       | High            |
| LED_RX     | Low                | High       | High            |
| LED_CRIS   | Low                | High       | High            |

## 6.6. Loopback Diagnostic Operation

### 6.6.1. Loopback operation

The RTL8029AS provides 3 loopback modes. By loopback test, we can verify the integrity of data path, CRC logic, address recognition logic and cable connection status.

**Mode 1:** Loopback through the NIC (LB1=0, LB0=1 in TCR).

The NRZ data is not transmitted to the SNI but instead it's loopbacked to the NIC's Rx deserializer. The traffic on the cable is ignored.

**Mode 2:** Loopback through the SNI (LB1=1, LB0=0 in TCR)

The Manchester encoded data is not transmitted to the MAU. It's loopbacked through the SNI to NIC. The traffic on the cable is ignored.

**Mode 3:** Loopback through the cable (LB1=1, LB0=1 in TCR)

The packets are transmitted via the MAU onto the network and RTL8029AS receives all incoming packets (not only the MAU-loopbacked Tx data) in the meantime.

### **□ Alignment of the Reception FIFO**

The reception FIFO is an 8-byte ring structure. The first received byte is put at location zero. When the location pointer goes to the end of the FIFO, it wraps to the beginning of the FIFO and overwrites the previous data. At the end of the packet reception, the FIFO contents are in the "order" (from the ring structure's view) as shown below.

#### **(1) CRC enabled (CRC bit in TCR=0)**

- ♦ 1-byte received packet data
- ♦ 4-byte CRC
- ♦ 1-byte lower byte count
- ♦ 1-byte upper byte count
- ♦ 1-byte upper byte count

#### **(2) CRC disabled (CRC bit in TCR=1)**

- ♦ 5-byte received packet data
- ♦ 1-byte lower byte count
- ♦ 1-byte upper byte count
- ♦ 1-byte upper byte count

## **6.6.2. To Implement Loopback Test**

### **(1) To verify the integrity of data path**

- ♦ set RCR=00H to accept physical packet
- ♦ set PAR0-5 to accept packet
- ♦ set DCR=43H
- ♦ set TCR=02H, 04H, 06H to do loopback test 1, 2, 3 respectively
- ♦ set CRC enabled (CRC=00H in TCR)
- ♦ clear ISR
- ♦ Tx a packet and check ISR
- ♦ check FIFO after loopback

Notes: Loopback mode 3 is sensitive to the network traffic, so the values of FIFO may be not correct.

### **(2) To verify CRC logic**

#### **□ Select a loopback mode (e.g. mode 2) to test**

##### **A. To test CRC generator**

- ♦ set RCR=00H to accept physical packet
- ♦ set PAR0-5 to accept packet
- ♦ set TCR=04H (CRC enabled)
- ♦ set DCR=43H
- ♦ clear ISR
- ♦ Tx a packet
- ♦ check CRC bytes in FIFO after loopback

##### **B. To test CRC checker**

- ♦ set RCR=00H to accept physical packet
  - ♦ set PAR0-5 to accept packet
  - ♦ set TCR=05H (CRC disabled)
  - ♦ set DCR=43H
  - ♦ clear ISR
  - ♦ Tx a packet with good or bad CRC appended by program
  - ♦ check FIFO, ISR & RSR after loopback
- For bad CRC, expected: ISR=06H, RSR=02H (Tx:OK, Rx:CRC error)  
 For good CRC, expected: ISR=02H, RSR=01H (Tx:OK, Rx:OK)

Notes: In loopback mode, the received packets are not stored to SRAM, so PRX bit in ISR isn't set.

### **(3) To verify the address recognition function**

#### **☐ Select a loopback mode (e.g. mode 2) to test**

##### **A. Right physical destination address**

- ♦ set RCR=00H to accept physical packet
  - ♦ set PAR0-5 to accept packet
  - ♦ set TCR=04H (CRC enabled)
  - ♦ set DCR=43H
  - ♦ clear ISR
  - ♦ Tx a packet
  - ♦ check ISR after loopback
- Expected: ISR=06H (packets accepted, Rx CRC error)

##### **B. Wrong physical destination address**

- ♦ set RCR=00H to accept physical packet
  - ♦ set PAR0-5 to reject packet
  - ♦ set TCR=04H (CRC enabled)
  - ♦ set DCR=43H
  - ♦ clear ISR
  - ♦ Tx a packet
  - ♦ check ISR after loopback
- Expected: ISR=02H (packets rejected, Rx no response)

### **(4) To Test Cable Connection**

#### **☐ There are four physical medium types in RTL8029AS.**

**We perform loopback mode 3 to test the cable connection status.**

- ♦ set RCR=00H to accept physical packet
- ♦ set PAR0-5 to accept packet
- ♦ set TCR=06H (CRC enabled)
- ♦ set DCR=43H
- ♦ clear ISR
- ♦ Tx a packet
- ♦ check TSR after loopback

**A. 10Base2**

If cable OK, get TSR=01H (Tx OK).

If cable FAIL, get TSR=0CH (Collision and Tx aborted).

**B. 10Base5**

If cable OK, get TSR=01H (Tx OK).

If MAU connected but cable FAIL, get TSR=0CH (Tx collision and Tx aborted).

If MAU not connected, get TSR=51H (Carrier sense is lost during transmission and CD heartbeat fails.).

**C. 10BaseT with link test disabled**

RTL8029AS disables link test in this case, so cable OK or FAIL doesn't affect TSR; get TSR=01H.

**D. Auto-detection (10BaseT with link test enabled)**

RTL8029AS automatically switches from 10BaseT to 10Base2 if the twisted-pair wire is not connected (10BaseT link test fails).

If twisted-pair wire OK, get TSR=01H (Tx OK) & BNC=0 in CONFIG2.

If twisted-pair wire FAIL but coaxial cable OK, get TSR=01H (Tx OK) & BNC=1 in CONFIG2.

Otherwise, get TSR=0CH (same as 10Base2 connection fail).

## 7. ELECTRICAL SPECIFICATIONS AND TIMINGS

### 7.1. Absolute Maximum Ratings

Operating Temperature ..... 0°C to 70°C  
 Storage Temperature ..... -65 °C to 140°C  
 All Outputs and Supply Voltages, with respect to Ground ..... -0.5V to 7V  
 Power Dissipation .....

#### Warning:

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only.

Functionality at or above these limits is not recommended and extended exposure to "Absolute Maximum Ratings" may affect device reliability.

### 7.2. D.C. Characteristics (T<sub>c</sub>=0 °C to 70 °C, V<sub>cc</sub>=5V±5%)

| Symbol          | Parameter                 | Min. | Typ. | Max. | Unit | Conditions               |
|-----------------|---------------------------|------|------|------|------|--------------------------|
| V <sub>il</sub> | Input Low Voltage         |      |      | 0.8  | V    |                          |
